

# Interface Module Adapter

## 6EZ2 for SIMATIC S7-300 und SIMATIC S7-400

Short Description March 2007

### Innovation on economical base

When we are talking to our customers there always seems to be a common problem: many plants are still operating with automation systems of the previous generation and although the performance is still sufficient, it will become increasingly difficult to get spare parts and to have an efficient service in the future.

To be up to date, it will be necessary to replace the existing system with a modern unit.

But quite often this decision is delayed by the fear of disruption of the running production and the inconvenience of long-term trouble shooting in case of miswiring.

**But that could be avoided!**

## 1 Application

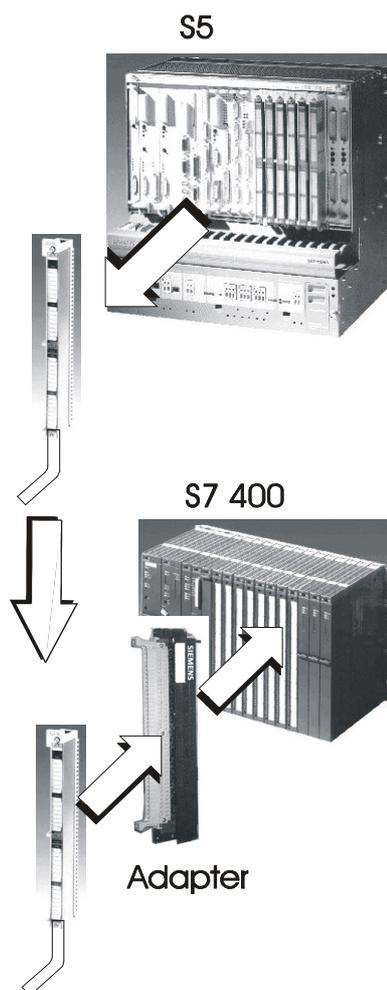

### Retrofit at ease

Siemens engineers have developed an elegant method to solve your problem:

- in a very short time
- without errors
- on a low cost level

The Interface Module Adapter for SIMATIC S7-300 or SIMATIC S7-400 links the old with the new, field proven production systems with the latest achievements in automation systems.

You simply take off the front plug of the I/O units, replace the automation system by a S7, plug in the IMA and fix the front plug back on to the adapter. You see, all is done easily by plugins. And after installation of the STEP 7 software you can continue with you production.

### Advantages are obvious

- There are low engineering costs in the hardware. Only a replacement of the controller is necessary. All wiring remains at its place.
- Schematic diagrams don't have to be revised; signal lists are automatically updated by the software.
- The shutdown time of the production is reduced.

This procedure not only saves you a lot of time and money, but also reduces errors.

## 2 Modul Types

### Types of controllers

The use of IMA is intended for the following controllers:

- S5 115 U
- S5 130 W/K
- S5 135 U
- S5 150 U
- S5 155 S/U
- S5 150 K

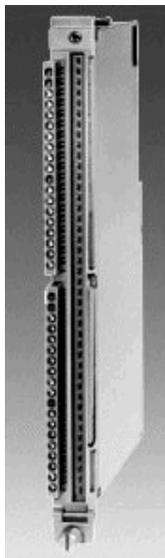

As substitution appliance the S7-300 or S7-400 controller is used.

### Digital Inputs

The digital inputs are classified by the following technical features:

- Number of channels: 8/16/32
- Potential separation: internal / external
- Grouping of channels: 1/4/8/16/32
- Signal voltage: TTL/24V=60V/115V~/230V~
- Switching frequency
- Type of connector: Screw/Crimp 42/20-poles
- Space requirement: single / double space
- Interrupt signal
- Enable signal
- Unit encoding
- Address encoding

All these specifications must be taken into consideration before the exchange.

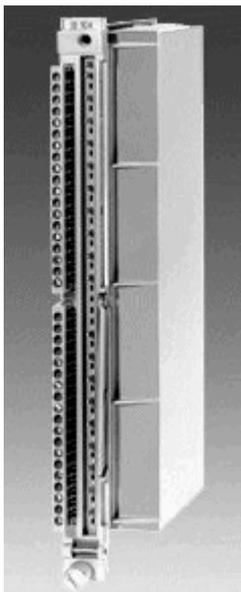

### Digital Outputs

The digital outputs are classified by the following technical features:

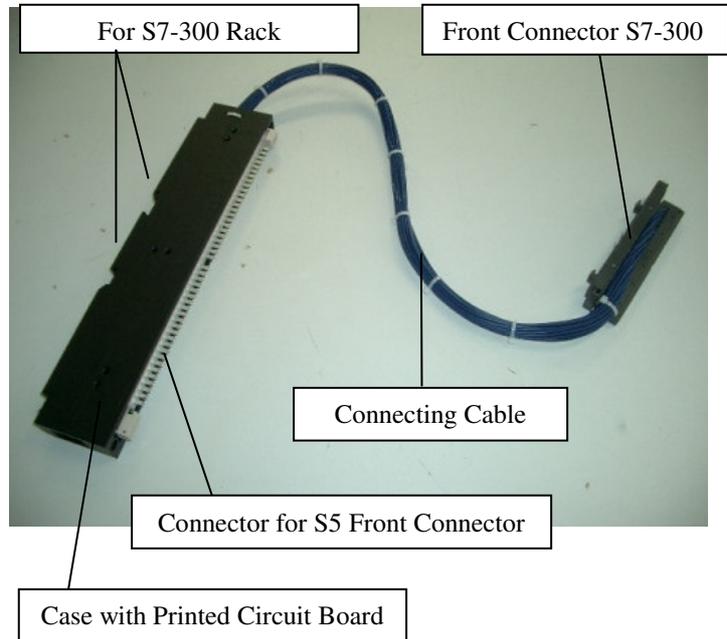

- Number of channels: 8/16/32
- Potential separation: internal / external
- Grouping of channels: 1/4/8/16/32
- Signal voltage: TTL/24V=60V/115V~/230V~
- Switching frequency
- Type of connector: Screw/Crimp 42/20-poles
- Space requirement: single / double space
- Short circuit protection: none / fuse / electronic
- Switching Capacity: 0,1/0,5/2A
- Voltage limitation
- Unit encoding
- Address encoding

All these specifications must be taken into consideration before the exchange.

#### Technische Daten

Anzahl steckbarer Peripheriebaugruppen	max.	7
Anzahl anschließbarer Erweiterungsgeräte - zentral	max.	3
Maße BxHxT (mm)		483 x 303 x 47
Gewicht		5 kg

## 5 Power Supply

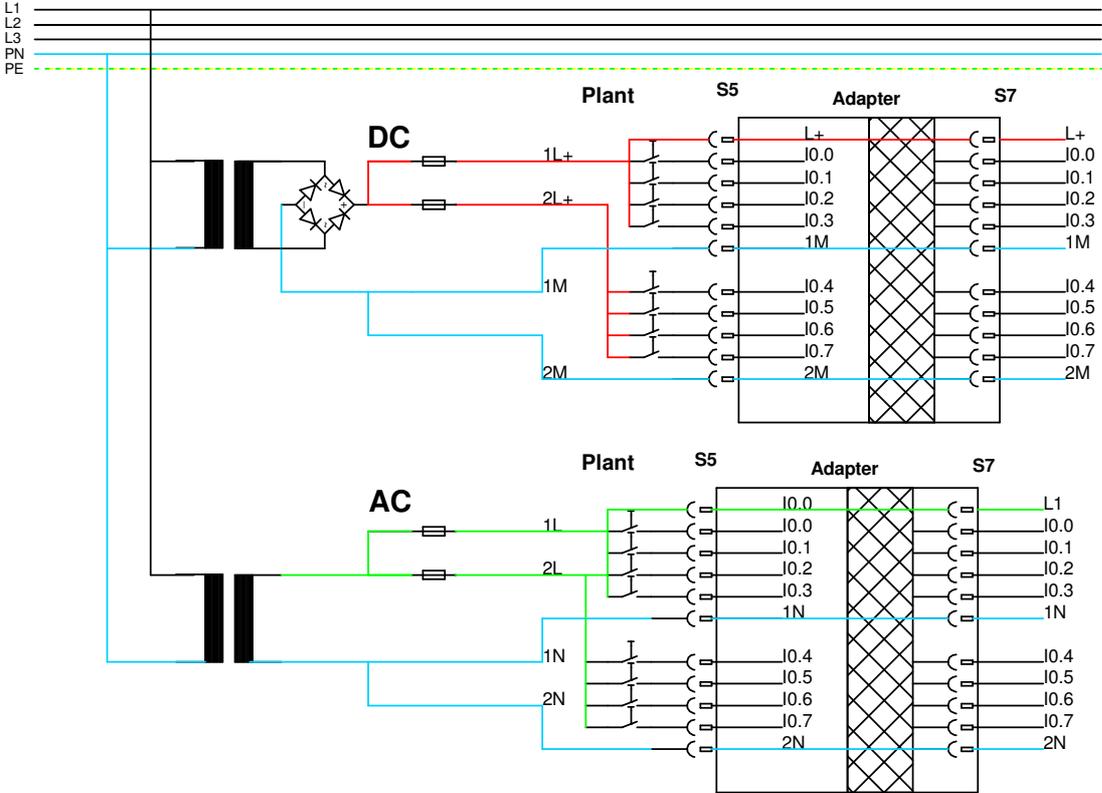

### 5.1 Separation of Potentials

There are floating or non-floating IOs. In both cases the power for the module has to be supplied by the user. Another criterion is the short circuit protection of the signals. The outputs have to be tested for the rating of the pins and the printed conductor. Therefore the power supply of signals is routed in groups of 1/2/4/8/16.

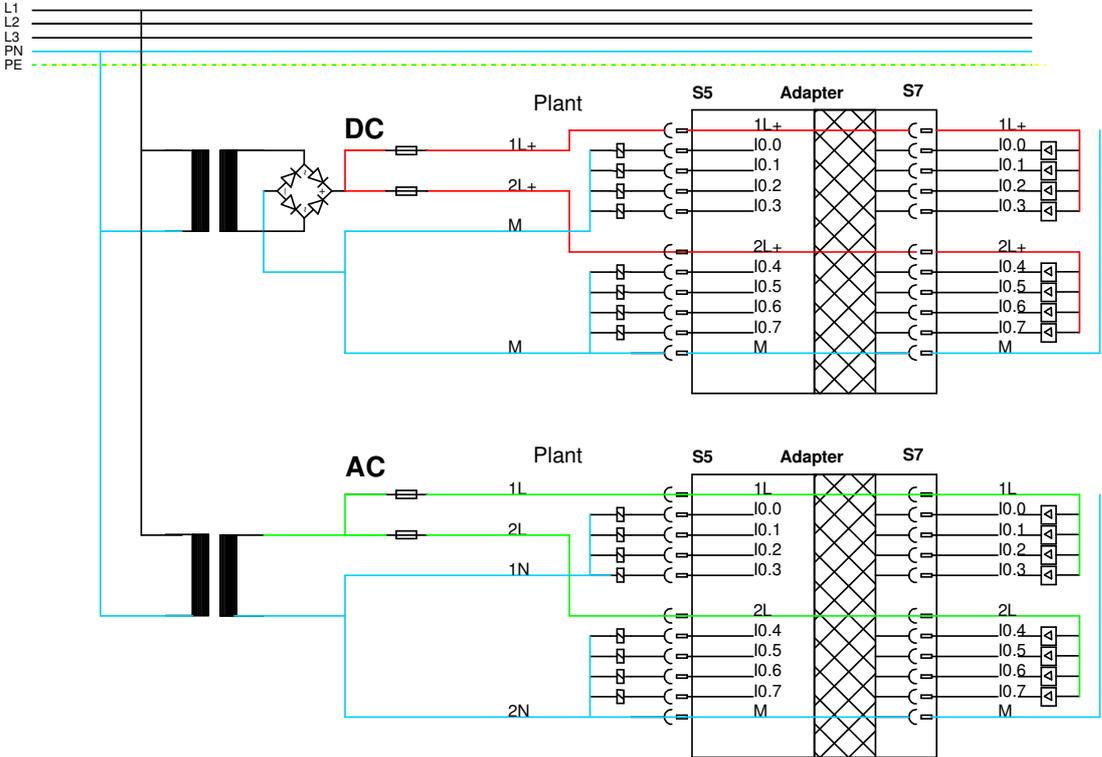

**Interface Module Adapter for SIMATIC S7**

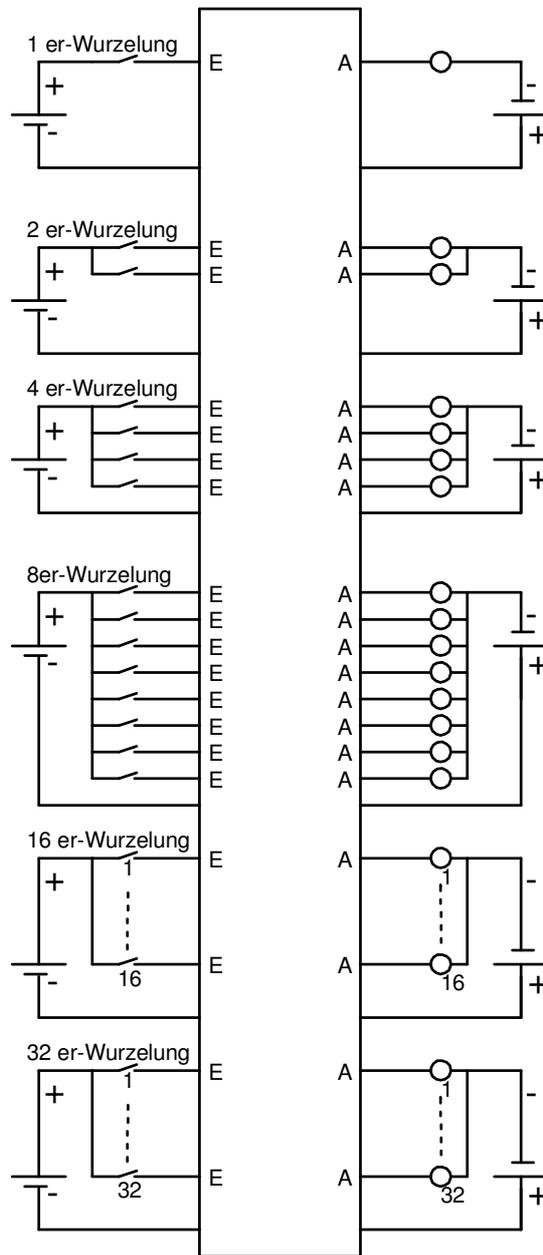

**5.2 Power Supply of Inputs**

**5.3 Power Supply of Outputs**

**5.4 Rooting**

## 6 Conditions of Sale

### 6EZ2 041-8UG...

The Interface Module Adapters 6EZ2 041-8UG.. are intended to be used between the front-plugs on the I-O-modules of an obsolete controller and a modern replacement controller SIMATIC S7. Hereby all installation remains at its place; only the controller and the respective software have to be substituted.

For the substitution of the up-to-now-used units the best matching units of S7- components were selected. However there remains a certain deviation in the specific performance. It is up to the user to check the limitations of his own installation, in particular the:

- Power supply
- Signal voltage
- Line-frequency
- Limits of I-O-definitions
- Rooting
- Number of channels
- Loading capacity
- Rating of connectors
- Signal switching frequency

If the S7-units do require an external application of +/- potentials and the old installation did not supply them, these potentials have to be brought to the terminal block on the adapter or to the S5 front connector .

If the power-rooting of the old installation is not corresponding to the new requirements, the user has to install the additional jumpers.

If the old installation was fed from different power sources, an equipotential bonding contactor has to be applied.

The enable –signal of the S5 units is not present in the S7-system in an identical way and may be considered on handling.

The parametering and selection of modes in the I/O-units has to be done according to the requirements of the S7.

The vendor is not liable for damages that are caused by improper use of the Interface Module Adapters. It is recommended to perform a field-test before the general switch-over of the new installation.
